The present sequence is human six transmembrane epithelial antigen of the prostate (STEAP)-2 clone GTD3 cDNA. STEAP is a member of cell surface serpentine transmembrane antigens. STEAP-2 gene is located on chromosome 7q21 and is used in gene therapy. Inhibiting the development or progression of a cancer (eg. prostate, colon, bladder, lung, ovarian and pancreatic) expressing STEAP or inhibiting growth or killing cells expressing to the patient, comprises administering a vaccine composition to the patient. Treating a patient with a cancer that expresses STEAP, or inhibiting growth or killing cells expresses STEAP, or inhibiting a patient with a cancer that expresses STEAP, or inhibiting growth or killing cells expressing STEAP, or inhibiting growth or killing cells expressing STEAP, or inhibiting growth or killing cells expressing steap, that comprises the variable domains of the heavy and light chains of the monoclonal antibody that specifically binds to STEAP, such that the vector delivers the single chain monoclonal antibody coding sequence to the cancer cells and the encoded single chain monoclonal
                                                                                                                                                                                                                                                                                                                                                                                                                            New STEAP proteins, cancer -

                                                                                                                                                                                                                                                                                                                                                                            뮍
                                                                                                                                                                                                                                                                                                                                                                                            CC The invention relates to substantially pure prostate-specific or CC testis-specific polypeptides and the nucleic acids encoding them. CC Also included are vectors and host cells expressing the proteins, a CC transgenic animal expressing the protein, antibodies against the CC proteins, probes for detecting the nucleic acids, antisense molecules CC for the nucleic acids and methods of isolating modulators of the CC proteins. Compounds that modulate the prostate specific or testis CC specific polypeptide are useful to diagnose, prevent or treat disorders CC of the testis or prostate particularly prostate cancer, benign CC prostatic hyperplasia, acute prostatitis, testicular cancer, cCC cryptorchidism, undescended, retractile, ascending or vanished testis. Other proliferative disorders for which the modulators may be CC used include lymphoma, leukaemia, melanoma, ovarian cancer, breast CC cancer, pancreatic cancer, liver cancer and lung cancer. The CC present sequence encodes prostate specific protein, Six-Transmembrane CC Protein of Prostate 1, STMP1, ORF2.

                                                                                                        В
                                                                                                                                Š
                                                                                                                                                                                                                               The invention relates to substantially pure prostate-specific or testis-specific polypeptides and the nucleic acids encoding them. Chalso included are vectors and host cells expressing the proteins, a curingenic animal expressing the protein, antibodies against the curing proteins, probes for detecting the nucleic acids, antisense molecules for the nucleic acids, antisense molecules conversing the protein acids, antisense molecules for the nucleic acids and methods of isolating modulators of the curing properties are useful to diagnose, prevent or treat disorders confine testis or prostate particularly prostate cancer, benign curing prostatic hyperplasia, acute prostatitis, testicular cancer, confined the modulators may be cused include lymphoma, leukaemia, melanoma, ovarian cancer, breast concer, pancreatic cancer, liver cancer and lung cancer. The curing prostate protein, Six-Transmembrane Protein of Prostate 1, STMP1.
                                                                                                                                                              Query Ma

testis-specific polypeptides and the nucleic acids encoding them. CC Also included are vectors and host cells expressing the proteins, a CC transgenic animal expressing the protein, antibodies against the CC proteins, probes for detecting the protein, antibodies against the CC proteins. Compounds that modulate the prostate specific or testis CC specific polypeptide are useful to diagnose, prevent or treat disorders compounds that modulate the prostate specific or testis CC of the testis or prostate particularly prostate cancer, benign CC prostatic hyperplasia, acute prostatitis, testicular cancer, cc cryptorchidism, undescended, retractile, ascending or vanished CC testis. Other proliferative disorders for which the modulators may be used include lymphoma, leukaemia, melanoma, ovarian cancer, breast cancer, pancreatic cancer, liver cancer and lung cancer. The prostate 1, STMP1, ORF3.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       В
             CC. The invention relates to isolated polynucleotide (I) and CC polymerase (II) sequences. (I) is useful as hybridisation probes, CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The CC and gene mapping, and in recombinant production of (II). The CC for identifying expressed genes. (I) is useful in gene therapy techniques CC for identifying expressed genes. (I) is useful in gene therapy techniques (II). (II) is useful for generating antibodies against it, detecting or CC quantitating a polyperide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating CC disorders involving aberrant protein expression or biological activity. The polypertide and polynucleotide sequences have applications in CC diagnostics, forensics, gene mapping, identification of mutations CC responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and CC andno acid sequences. AAS64197 AAS94564 represent novel human CC Note: The sequence data for this patent did not appear in the printed CC specification, but was obtained in electronic format directly from WIPO.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         밁
polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, ollgomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tagging identifying expressed genes. (I) is useful in gene therapy techniques.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                         quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic coding sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO as fet many contact the sequence of the invention.

derived from mRNA of human breast, and then measuring the label

bound to each probe of the microarray. The probes are useful for

cerifying the expression of regions of genomic DNA predicted to

cencode proteins. They are useful for gene discovery, and for

cencode proteins. They are useful for gene discovery, and for

cetermining predisposition and/or prognosing breast disease. Gene

cexpression analysis is useful for assessing the toxicity of chemical

cagents on cells. The microarray of this invention presents a far greater

diversity of probes for measuring gene expression, with far less bias

than expressed sequence tag microarrays. The method is suitable for

crapid production of functional information from genomic sequence. The

present sequence is a single exon nucleic acid probe of the invention.

Note: The sequence data for this pattent did not form part of the

printed specification, but was obtained in electronic format directly

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a single exon nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   09-AUG-2001

                                                        The present invention relates to single exon nucleic acid probes for measuring human gene expression in a sample derived from human heart. The present sequence is one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular systems. The probes are useful disease, hypertension, cardiac arrhythmias and e.g. cardiavascular disease, hypertension, cardiac arrhythmias and

                                                                                                                                                                                                                                                                                                                                                The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers

                                                (SENP). The present sequence is one such probe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer.

Note: The sequence data for this patent did not form part of the printe specification, but was obtained in electronic format directly from WIPR at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                         Claim
                                                                                                                                                                                                                                                                                                                                                                                       analyzing

```
Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      nucleic search, using sw model

                    /note="Vector: py7y31-Pac (pharmacia) with a modified polylinker; Site_1: Not I; Site_2: Eco RI; The NIH_BMAP_M_S4 library is a subtracted library of a series, ultimattely derived from a mixture of individually tagged normalized libraries from ten regions of the mouse brain (cerebellum, brain stems, olfactory bulbs, hypothalamus, cortex, amygdala, basal ganglia, pineal gland, striatum, hipoccampus) after a series of subtractions to reduce the representation of cDNAs from which ESTs had already been generated. The following serially subtracted libraries were generated in this process: NIH_BMAP_M_S3.1, NIH_BMAP_M_S3.2, NIH_BMAP_M_S3.2, NIH_BMAP_M_S3.2, NIH_BMAP_M_S3.1, NIH_BMAP_M_S3.2, NIH_BMAP_M_S3.2, NIH_BMAP_M_S3.2, and NIH_BMAP_M_S3.2, and NIH_BMAP_M_S3.1 clones from which 3' ESTs had been derived was used as a driver in a hybridization with a pool of the NIH_BMAP_M_S3.3, NIH_BMAP_M_S3.2, and NIH_BMAP_M_S3.1 libraries in the form of single-stranded circles. The remaining single-stranded circles (subtracted library) was purified by hydroxyapatite column chromatography, converted to double-stranded circles and electroporated into DH10B bacteria (LifeTechnologies) to generate the NIH_BMAP_M_S4 library. This procedure has been previously described (Bonaldo, Lennon and Soares, Genome Research TAG_ELB-NIH_BMAP_M_S4

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWNA2 (gil4732114/gblAF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XIIO-Gold (Stratagene) cells and selected for ampicillin resistance."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /note-wester pm713D-Pac (Pharmacia) with a modified polylinker; Site_1: Not I; Site_2: Eco RI; The UI-R-E1 library is a subtracted library derived from the UI-R-E0 library. The UI-R-E0 library consisted of a mixture of individually tagged normalized libraries constructed from 8, 12 and 18-day embryo. The tag is a string of 3-5 nucleotides present between the Not I site and the oligo-dT track which allows identification of the library of origin of a clone within the mixture. The subtracted library (UI-R-E1) was constructed as follows: PCR amplified cDNA inserts from a pool of UI-R-E0 clones from which 3' ESTs had been derived was used as a driver in a hybridization with the UI-R-E0 library in the form of single-stranded circles. The remaining single-stranded circles (subtracted library) was purified by hydroxyapatite column chromatography, converted to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Res. 6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1996)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             double-stranded circles and electroporated into DH10B bacteria (Life Technologies) to generate the UI-R-EI library. This procedure has been previously described (Bonaldo, Lennon and Soares, Genome Research 6: 791-80
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /strain="Sprague-Dawley"
